

Fertilizers: Natural, Corn Gluten, Zero Phosphate, and Blended Formulations

Fertilizers are the corner stone of any turf building campaign, used to thicken grass and help provide that dark green color everyone desires. There are seemingly more fertilizers available than stars in the night sky, and this can be very confusing to the average homeowner or even professionals for that matter. The good news is that we have done all the research and testing for you! We have a limited selection of great fertilizers from organic, to natural, to blended formulations used to control insects or weeds. Whatever the need or use, we have the fertilizer to get the job done right.

Natural

If your preference is natural, it may be because you do not like synthetic blends or perhaps you demand a slow release formulation. Whatever your reasons, we have several great Natural fertilizers which are slow release in function and are great at greening up turf. When used consistently, these fertilizers will help thicken your lawn by enhancing growth during the year.

Corn Gluten

Corn Gluten fertilizer has become an increasingly popular spring treatment to help reduce crabgrass and some annual weeds while providing a large amount of nitrogen to a lawn. Research shows that for best results, this type of product should be used for several years in order to receive best performance. Corn Gluten is an organic fertilizer and as such, is required in very large volumes to achieve not only color but crabgrass inhibition.

Zero Phosphate

As many people are aware, new state legislation demands the use of low phosphate slow-release fertilizers when making applications beyond 25ft of many water sources. As a result, we have chosen a fertilizer specifically for this type of lawn environment. In fact, we have a slow-release fertilizer with no phosphorus to exceed these environmental regulations.

Blended Formulations

Many home owners do not appreciate broadleaf weeds or insects destroying their green living spaces. We recognize the need for tactically timed applications to reduce broadleaf weeds or stop turf loss by insect infestations. Since many of these products work better when combined with fertilizer, they are often blended with specific formulations in mind for maximum results. Reducing the competition often results in better long term results by using these products in the short term. Needless to say, we offer a wide variety of blended fertilizers designed to reduce weeds or insects while simultaneously promoting healthy turf.
