

Viburnum Leaf Beetle

Pyrrhalta virburni (VLB)

Affected Species

Many thinner-leaved viburnums including Cranberry, Arrowwood, Maple Leaf and Nannyberry viburnums.

Symptoms/Damage

Both the larvae and adult stages are voracious feeders, causing skeletonization and extensive defoliation. Successive years of defoliation will kill the plant.

Treatment

Many traditional and natural products are effective. Fall systemic treatments suppress the following year's larval stage.

Treatment Timing

Larvae early May - June, adults July - August
